

# SITE CLASSIFICATION LOT 122 58 HARRIS ROAD GOBBAGOMBALIN NSW 2650

May 2020

# **Project brief**

At the request of Simone Jorgensen of MJM Consulting Engineers, soil sampling, analysis and reporting was carried out to assess the site for a proposed residential development on 5 May 2020. The document provides information about the site and soil conditions from field observations and laboratory analysis.

### Site identification

Address: Lot 122 58 Harris Road Gobbagombalin NSW 2650

Real property description: Lot 122 subdivision of Lot 8 DP 1242840

Centre co-ordinate: 530928 6119329 MGA GDA z55

**Property size**: 717m<sup>2</sup> approximately

Owner: c/o Simone Jorgensen of MJM Consulting Engineers

Local Council Area: Wagga Wagga City Council

Present use: Vacant Block

**Development Application Reference:** not known

Report Number: 6724\_Lot 122

Site Classification: MD - Moderately Reactive Deep Drying

# Certification

Name	Signed	Date	Revision Number
David McMahon BAppSc SA GradDip WRM MEnvMgmt	THE	19/05/2020	0

# Physical characteristics of the site

A desktop review and investigation of the topography, hydrology, soil, lithology, geology and hydrogeology of the site has been undertaken and are as follows:

# **Topography**

The Wagga Wagga 1:25,000 Topographic Map (Sheet 8327-1N) indicates that the site is located at an elevation of approximately 222m AHD. The site landform is classed as a simple slope and the slope class is moderately inclined.

# Vegetation

The site is devoid of vegetation.

# Hydrology

The nearest named waterway is Murrumbidgee River located 2km to the south of the site. Due to the relative incline of the site, rainfall is likely to both run off and infiltrate into the relatively permeable topsoil.

#### Weather

The average rainfall for Wagga Wagga is approximately 526.8mm per annum, with the wettest months being October, June and July. Annual mean evaporation for the region is 1715.5mm with mean daily evaporation ranges from 1.2mm in July to 9.2mm in January. Wagga Wagga is characterised by cold wet winters and hot dry summers with mean maximum temperatures ranging from 12.9°C in July to 31.9 °C in January and mean minimum temperatures ranging from 1.3°C in July to 15.9°C in February. Rainfall, temperature and evaporation data from Wagga Wagga Agricultural Institute 73127 (www.bom.gov.au).

#### Soil & Landform

The site lies within the mapping unit ld from the Soil Landscapes of the Wagga Wagga 1:100 000 Sheet (DLWC, 1997). The map unit ld is described as:

#### Id – Lloyd (Erosional Landscapes)

Landscape: rolling low hills of Ordovician metasedimentary rocks. Local relief 30 - 60 m; slope gradients 10 - 20%. Broad crests and ridges, long waning mid to lower slopes, and broad drainage depressions. Extensively to completely cleared mid-high openforest.

Soils: shallow (<50 cm) Paralithic Leptic Rudosols on crest, ridges and upper slopes; moderately deep (50 - 100 cm) Mesotrophic Red Chromosols on mid to lower slopes and moderately deep (80 - 150 cm) Mottled Mesonatric Brown Sodosols in drainage lines

*Limitations*: high erosion hazard, steep slopes (localised), foundation hazard (localised), mass movement, shallow, stony and strongly acid soil (localised on ridges and upper slopes).

# Lithology and Geology

Undivided Ordovician metasedimentary rocks-thinly interbedded siltstones, shales, and phyllites, with minor schists and minor quartzites. Lithology is highly variable in short distance. Relatively thick 0 - >3 m) colluvial and slope-washed clayey sediments occur on lower slopes and in drainage depressions.

### Hydrogeology

From the Geoscience Australia hydrogeology dataset, the groundwater beneath the site is described as porous, extensive highly productive aquifers

# **Site Condition**

Through site investigation, field observations, in situ tests and laboratory analysis the following site geotechnical model has been developed. Details of the general conditions encountered with a field description of the soil, engineering properties and the location of the boreholes can be seen as follows, Table 1, Figure 1.

**Table 1:** Site geotechnical model with field description and observations

Soil Origin	Depth (m)	Class (AS1726 -2017)	Soil Name / Description	Grain Size	Primary Colour	Mottle Colour	Mois- ture	Plas- ticity	Consis- tency	Observations and/or comments	Engineering Properties
Borehole 1	1										
Colluvial	0.0-0.4	ML	Sandy SILT	Fine- Med	Brown	Nil	М	Low	Stiff	-	-
Residual	0.4-1.5	CL	Silty CLAY	Fine- Med	Reddish Brown	Nil	D	Low- Med	Stiff	-	Ys Expansivity 20-40mm

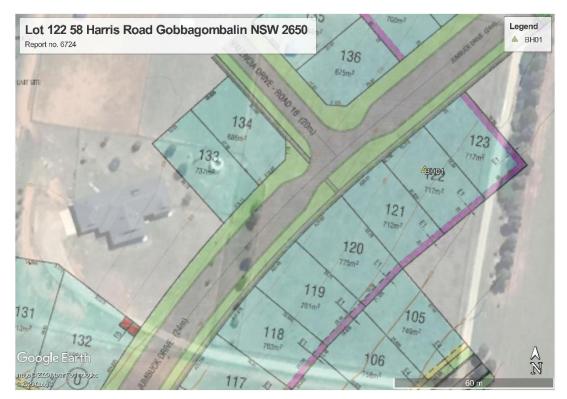

Figure 1: Annotated site plan overlain on aerial photograph depicting borehole locations

#### Site Classification

Based on the field assessment and laboratory data and assumptions therein the site is classified as **MD - Moderately Reactive Deep Drying** by reference to AS2870:2011.

# **Assumptions**

Site investigation and classification was carried out by reference to AS2870:2011.

The proposed building is a single storey residential development.

This classification is based on the footings being founded into the underlying CL material. If the footings are not into the specified material the site classification will need to be reassessed.

An allowable bearing pressure of up to 50kPa and 100kPa for raft slab beams and strip footings respectively may be adopted.

If more than 0.4m of uncontrolled fill is present or placed, or if depth of excavation within the building area extends more than 0.5m below the existing surface, the above classification will need to be reassessed.

Any earthworks on site will be carried out by reference to AS3798: 2007.

If any unconsolidated or saturated soils are encountered during excavation, or conditions that are not alike the above description, the site supervisor should be informed, the work stopped and this office be contacted immediately for further evaluation.

Where trees and large shrubs are removed from the site all roots are to be removed and voids replaced with compacted fill by reference to AS3798:2007.

The soils investigated are all natural ground and no free groundwater was encountered at the time of the investigation.

Site drainage and vegetation limitations are adhered to as per the CSIRO Foundation Management and Footing Performance: A Homeowner's guide, BTF-2011

**Notes Relating to Results** 

	ı vcı	Cumbal				
Soil Origin		TOPSOIL	<b>Definition</b> Mantle of surface and/or near-surface soil often but not always defined by high levels of organic material, both dead and living. Remnant topsoils are topsoils that subsequently been buried by other transported soils. Roots of trees may extend significantly into otherwise unaltered soil and			
			the presence of roots is not a sufficient reason for describing a material as topsoil.			
		FILL	Any material which has been placed by anthropogenic processes			
		Alluvial	Deposited by streams and rivers			
		Colluvial	Soil and rock debris transported down slope by gravity, with or without the assistance of flowing water and generally deposited in gullies or at the base of slopes. Colluvium is often used to refer to thicker deposits such as those formed from landslides, whereas the term 'slopewash' may be used for thinner and more widespread deposits that accumulate gradually over longer geological timeframes.			
		Extremely weathered material	Formed directly from in situ weathering of geological formations. Although this material is of soil strength, it retains the structure and/or fabric of the parent rock material.			
		Residual	Formed directly from in situ weathering of geological formations. These soils no longer retain any visible structure or fabric of the parent soil or rock material			
Class		GW	Gravel and gravel-sand mixtures, little to no fines			
(AS1726-	<u>s</u>	GP	Gravel and gravel-sand mixtures, little to no fines, uniform gravels			
2017)	Coarse grained soils	GM	Gravel-silt mixtures and gravel-sand-silt mixtures			
	)ed	GC				
	rair		Gravel-clay mixtures and gravel-sand-clay mixtures			
	Se C	SW	Sand and gravel-sand mixtures, little to no fines			
	oar	SP	Sand and gravel-sand mixtures, little to no fines			
	O	SM	Sand-silt mixtures			
		SC	Sand-clay mixtures			
		ML	Inorganic silt and very fine sand, rock flour, silty or clayey fine sand or silt with low plasticity			
	oils	CL, CI	Inorganic clays of low to medium plasticity, gravelly clay, sandy clay			
	Fine grained soils	OL	Organic silt			
	aine	MH	Inorganic silt			
	g	СН	Inorganic clays of high plasticity			
	Fine	ОН	Organic clay of medium to high plasticity, organic silt			
		Pt	Peat, highly organic soil			
Soil Name/		SAND	Coarse grained soil			
Description		SILT	Fine grained soil – low dry strength, low wet toughness and dilatancy			
		CLAY	Fine grained soil – high dry strength, high wet toughness and plasticity			
Grain Size		Coarse	>2mm			
		Medium	0.06 – 2mm			
		Fine	<0.06mm			
Moisture		D	Dry			
		Т	Moderately Moist			
		M	Moist			
Plasticity		W	Wet			
		Non-plastic	Not applicable			
		Low	Only slight pressure is required to roll the thread of soil near the plastic limit. The thread and lump are weak and soft. The dry specimen crumbles into powder with some finger pressure.			
		Medium	Medium pressure is required to roll the thread of soil to near the plastic limit. The thread and lump have medium stiffness. The dry specimen breaks into pieces or crumbles with considerable finger pressure.			
		High	Considerable pressure is required to roll the thread to near the plastic limit. The thread and the lump have very high stiffness. The dry specimen cannot be broken with finger pressure. Specimen will break into pieces between thumb and a hard surface.			
Consistency		Very Soft (VS)	Exudes between fingers when squeezed in hand			
		Soft (S)	Can be moulded by light finger pressure			
		Firm (F)	Can be moulded by strong finger pressure			
		Stiff (St)	Cannot be moulded by fingers			
		Very Stiff (VSt)	Can be indented by thumb nail			
		Hard (H)	Can be indented by thumb nail with difficulty			
		Friable (Fr)	Can be easily crumbled or broken into small pieces by hand			
		1 114515 (1 1 <i>)</i>	can be easily enumbed of broken into small places by name			

#### **Disclaimer**

The information contained in this report has been extracted from field and laboratory sources believed to be reliable and accurate. DM McMahon Pty Ltd will not assume any responsibility for the misinterpretation of information supplied in this report. The accuracy and reliability of recommendations identified in this report need to be evaluated with due care according to individual circumstances. It should be noted that the recommendations and findings in this report are based solely upon the said site location and the ground level conditions at the time of testing. The results of the said investigations undertaken are an overall representation of the conditions encountered. The properties of the soil within the location may change due to variations in ground conditions outside of the tested area. The author has no control or liability over site variability that may warrant further investigation that may lead to significant design changes.
